

PRODUCT & COMPANY VISION

**On-chain intelligence
for global crypto markets**

Built in India

Wallet research today. Proprietary trading and market making as the long-term direction.

EXECUTIVE OVERVIEW

The business begins with intelligence

The product

Explain wallet activity, position flows and token-specific trading records.

The customer

Independent traders, research teams and proprietary trading firms.

The direction

Validate a subscription product before expanding into trading with firm capital.

CUSTOMER NEEDS

Different users. A common research burden.

Traders

Find relevant wallets without confusing headline PnL with repeatable performance.

Quant researchers

Inspect complete trade samples and test sensitivity to execution costs.

Trading desks

Trace positioning changes to source wallets and understand concentration.

POSITION-FLOW ATTRIBUTION

A buy can open a long or close a short

Long inflow / outflow

Separate new long exposure from closed longs.

Short inflow / outflow

Separate new short exposure from short covering.

Wallet attribution

Inspect the addresses behind each coin's flow and test the largest contributor's influence.

WALLET DISCOVERY

A relevant record for each token

Wallet screening

Address lookup, reported PnL, account coverage and reconstructed trading quality.

Token specialists

Coin-level win rate, profit factor, drawdown and complete trade count.

EXECUTION REALISM

Copy research starts with eligibility

0 / 5 / 10 / 25 bps

Additional execution-cost scenarios

Performance evidence

Positive reported 30-day and all-time PnL, sufficient history and consistency.

Execution fit

Recent activity, funded accounts, holding periods and cost resilience.

CURRENT SCOPE

Cross-asset research within covered venues

Crypto

Major and smaller perpetual markets with source-linked wallet activity.

Equity and index exposure

Covered builder-DEX derivatives alongside main-DEX positions.

Commodities and FX

Classified instruments and RWA activity in the indexed sample.

POSITIONING COMPASS

Direction and evidence are separate scores

45%**New exposure**

Opening balance between long and short positions.

35%**Token specialists**

Bounded wallet votes backed by relevant token records.

20%**Execution balance**

Buy and sell activity, including position closures.

IMPLEMENTATION STATUS

A local product with explicit boundaries

Implemented

Wallet and token research, flows, market briefs, event context, reports and alerts.

Data foundation

Direct Hyperliquid APIs, selected live streams and a bounded local execution archive.

Not yet launched

Hosted subscriptions, live copy execution, multi-chain collection and the LLM copilot.

INTELLIGENCE ROADMAP

Planned research into wallet behaviour

Pre-move positioning

Study wallets that repeatedly build positions before large market moves.

Wallet continuity

Investigate possible destination addresses after observable capital movements.

Evidence first: timing does not prove privileged information, and a transfer does not prove common ownership.

Both capabilities are planned research. No front-running execution or identity claim.

PLANNED LLM COPILOT

Research, one prompt away

“Which ETH specialists opened new longs and still have a strong record after costs?”

Structured queries

Translate the request into validated filters over permitted data.

Traceable answers

Return source wallets, timestamps, calculations and missing-data warnings.

Read-only research first. No invented metrics or automatic trade execution.

PLANNED EXPANSION

Broader on-chain activity coverage

More venues and chains

Prioritise supported public data based on pilot demand and collection cost.

More activity types

Extend research into transfers, liquidity changes and positions with clear attribution.

Comparable evidence

Normalise instruments, timestamps and coverage without hiding data gaps.

COMMERCIAL MODEL

A focused subscription product

\$10

per month

Target individual plan

Team workflows

Shared research, exports and API access are potential extensions after pilot validation.

COMPANY ROADMAP

Three phases. Clear launch gates.

01 Intelligence software

Prove usefulness, repeat usage and sustainable delivery costs.

02 Proprietary trading

Validate strategies after costs and introduce controlled firm-capital exposure.

03 Market making

Build resilient quoting, inventory management and venue relationships.

No separate infrastructure-provider phase. Progress depends on evidence, capability and capital.

PHASES 2 AND 3

Trading businesses require their own proof

Proprietary trading

Research patterns and inefficiencies.
Forward-test strategies and apply
exposure and loss limits.

Market making

Develop two-sided quoting and inventory
controls. Evaluate adverse selection,
hedging and venue risk.

PRODUCT VALIDATION

The next measurable milestones

Coverage quality

Measure freshness, data gaps, complete histories and cost per active user.

Research quality

Record forward results, false signals and execution-cost sensitivity.

Customer value

Run a trader and prop-desk pilot. Measure repeated use and willingness to pay.

FOUNDER

Vivek Gautam

Formerly at GoQuant

Former intern at QuantInsti

Currently an analyst at a crypto firm

**Transparent crypto research,
built in India for global users.**
